

What Is VSAT Broadband?

VSAT broadband is similar to cable and DSL services for your computer. It is Internet service through a satellite dish that is placed on your home or business. It is another option for a high-speed Internet connection that is considered to be one of the best technologies available today.

One of the greatest advantages of VSAT broadband is that you do not need any special software, hardware or networks to use it. It works with nearly any email provider and uses a satellite dish that is like the ones used for satellite TV. A person or business can use what they have and not have to digest and learn a lot of new information before being able to use their computer.

Many people are curious about weather issues with a satellite Internet connection. Although the weather can impact your satellite TV use, this does not happen with VSAT technologies. The dish is larger, which makes weather problems almost nonexistent. The only requirement for this dish is being able to place it so that it faces the southern sky to access the satellite. The satellite coverage of the planet is also quite extensive, so that you can have the high-speed access you desire almost everywhere.

There are many other advantages to using this type of Internet connection. It is very easy to use, the connections are extremely fast, and the service is flexible and always reliable. For both companies and individuals, this is very important. You can connect to the Internet anywhere, at any time. This includes customer service, as well. It does not matter what time you have a question, there is someone available to answer it. The possibilities with this technology are endless.

VSAT broadband offers top of the line VPN encryption for the security of your personal information and data. They also offer full services for things like web hosting, net meeting, etc.

This type of Internet connection is also great for areas that are rural or are perhaps underserved by reliable Internet Service Providers. In areas like this, new Internet service capabilities are often not cost-effective. Many of these areas cannot afford to have Internet service that does not have outages. Internet services in these types of areas can also be expensive and the ISPs do not often have the latest technology to offer to their subscribers. Dial-up service is the norm in rural areas or small towns. VSAT broadband is a way to have the latest technology without having to go through a local ISP.

For companies, VSAT broadband offers a single vendor for all of their services. The convenience of this service is a great time saver for both small and large businesses. This makes paying bills easier, sending emails a quicker process, and allows for easy understanding among employees.

The cost of VSAT broadband service is comparable to other types of service. It takes only 14 days to get the service, and the installation of the dish can be done in about 3-6 hours. VSAT broadband is definitely a wave of the future.
